Problem 1: Consider a flow $\Phi(t,x) = \Phi^t(x)$ on the real axis, $x \in \mathbb{R}$.

(i) Prove or disprove: any periodic orbit is stationary, i.e.

$$\exists\, p > 0 \;:\; \Phi(p, x_0) = x_0 \quad \Longrightarrow \quad \forall\, t \in \mathbb{R} \;:\; \Phi(t, x_0) = x_0$$

(ii) What are possible α-limit and ω-limit sets of an orbit of Φ? (Consider bounded and unbounded orbits.)

Problem 2: Consider a flow Φ on $\mathbb{R}^N$, $N \geq 2$. The orbit $\Phi^t(x_0)$ of x_0 is assumed to possess arbitrarily small periods, i.e.

$$\forall\, \varepsilon > 0 \;\; \exists\, 0 < p < \varepsilon \;:\; \Phi_p(x_0) = x_0.$$

Prove: x_0 is an equilibrium.

Problem 3: Consider the map

$$\Phi^t(x) \;:=\; \begin{cases} \dfrac{1}{\frac{1}{x} - t} & \text{for } x \neq 0 \text{ and } \frac{1}{x} \neq t \\ 0 & \text{for } x = 0 \end{cases}$$

for $x \in \mathbb{C}$ and $t \in \mathbb{R} \setminus \{1/x\}$.

(i) Check the local flow properties for Φ^t and determine the minimal time $\underline{t}(x_0)$ and the maximal time $\overline{t}(x_0)$ of existence for every $x_0 \in \mathbb{C}$.

(ii) Which vectorfield is associated to Φ^t?

(iii) Determine the α- and ω-limit sets $\alpha(x_0)$ and $\omega(x_0)$ for every $x_0 \in \mathbb{C}$.

(iv) Find all bounded / unbounded / stationary / periodic / homoclinic / heteroclinic trajectories.

Problem 4: Prove that linear flows commute if and only if their linear vector fields commute. In other words, consider real $(N \times N)$-matrices A, B and flows

$$\Phi^t \;:=\; \mathrm{e}^{At}, \qquad \Psi^t \;:=\; \mathrm{e}^{Bt} \;:=\; \sum_{k=0}^{\infty} \frac{1}{k!} B^k t^k.$$

and prove that

$$AB \;=\; BA \qquad \Longleftrightarrow \qquad \forall t \in \mathbb{R} \;:\; \Phi_t \Psi_t \Phi_{-t} \Psi_{-t} = \mathrm{id}.$$

Hint: Consider $\left.\frac{\mathrm{d}^2}{\mathrm{d}t^2}\right|_{t=0} (\Phi_t \Psi_t \Phi_{-t} \Psi_{-t})$.
